

Swarmfront V1 Replay Share Funnel

Discord-first distribution architecture with install and replay fallback logic

Why this matters: This is not icing. This is cake. Replays are not just content; they are a growth funnel. Every shared match should be designed to convert a viewer into an install, an open, or a challenge.

1. Core V1 Flow

The canonical share link should be a Swarmfront URL, not a raw App Store link. Example: **swarmfront.com/replay/ABC123**

1. Share Event	2. Canonical URL	3. Smart Routing	4. Conversion Step
Match ends or highlight triggers	Discord/X post contains the Swarmfront replay URL	If app installed: open replay in app	Viewer watches, installs, opens, or challenges
Auto-post or one-tap share	Same link works everywhere	If app not installed: land on replay page with store CTA	Single system serves social, mobile, and desktop

2. Recommended Routing Logic

- Watcher taps a replay post in Discord or X.
- Operating system checks whether Swarmfront is installed and registered for the replay URL.
- If installed, the replay opens directly inside the app at the correct match or highlight state.
- If not installed, the viewer lands on a lightweight replay page showing match context, stakes, and a clear Play Now button.
- The Play Now button routes to the App Store or Google Play. Desktop users can stay on the web replay page.

3. What the Replay Landing Page Should Show in the First 5 Seconds

- Who played: player names, team or squad identity, and whether the match was ranked, private, or cash-based.
- Why it mattered: match stakes, comeback status, tournament impact, leaderboard movement, or rivalry context.

- Why it is worth watching: a concise headline such as “3:42 comeback win” or “\$50 sweep in overtime.”
- What to do next: Watch Replay, Open in App, Install, or Challenge This Player.

4. Platform Strategy for V1

Platform	V1 Behavior	Why
Discord	Auto-post supported	Best fit for team channels, squad feeds, replay drops, and match alerts.
X	One-tap share first; expand later if API access makes sense	Good for public brag posts and competitive visibility.
Instagram / TikTok	One-tap export/share, not true full automation	Useful for creator-style growth, but not the backbone of the funnel.
Web	Always supported	Gives every share a stable universal destination and analytics layer.

5. V1 Product Principle

The goal is not to dump viewers straight into a store page. The goal is to **show the hype first**, then convert. The replay page is the bridge between social discovery and install intent.

6. MVP Build Order

- Generate deterministic replay IDs and a canonical replay URL for every shareable match.
- Build a replay landing page with lightweight metadata, call to action, and app/store routing.
- Support Discord auto-posting for opted-in users, teams, or channels.
- Add one-tap share for individual players after match end.
- Track analytics across opens, installs, replay watches, and challenge clicks.

7. Swarmfront-Specific Bottom Line

This feature belongs in V1 because it directly addresses the hardest launch problem: critical-mass multiplayer acquisition. A premium-looking game matters, but a great game with a built-in distribution loop can beat prettier competitors that rely only on paid acquisition.

Implementation Note

Technical basis: this flow uses standard deep-link architecture—iOS Universal Links and Android App Links—to open installed app content from a shared URL, with web and store fallback behavior handled by the same canonical replay link. Discord can distribute the URL, while the OS handles the routing.
