

Swarmfront Quick Start Guide

The Basics

The object of Swarmfront is simple: capture and defend hives until your opponent has none left. Every hive continuously produces bees. The larger the hive, the faster it produces them, so growing your economy is just as important as attacking.

Creating and Managing Lanes

There are two ways to create a lane:

1. Tap Method

Tap the source hive, then tap the destination hive.

2. Drag Method

Tap and hold the source hive, drag to the destination hive, then release.

If both hives are yours, performing either action again will reverse the direction of the lane.

To remove a lane completely—whether it's a friendly lane or an attack lane—double tap **the source half of the lane** (the half closest to the sending hive). The lane will immediately disappear.

Swarms

Swarms are one of the most powerful mechanics in the game, but they come with a cost.

You can launch a swarm in one of two ways:

- Instance an existing lane in the same direction.
- Double tap the **destination half** of an existing lane.

A swarm begins with **5 attack power**. As it travels down the lane, it absorbs every friendly bee it encounters. For example, if it starts at 5 and picks up 3 more bees along the way, it will strike the enemy hive with **8 power**.

Unlike normal lane traffic, a swarm cannot be intercepted while traveling. Whatever power it has when it reaches its destination will arrive.

The downside is that the launching hive goes into recovery for a few seconds. During that time:

- It cannot send bees.
- It cannot receive incoming bees.
- It cannot launch another swarm until its cooldown expires.

Choose your timing carefully.

Super Swarms

Here's where things get fun.

If you swarm into a **friendly** hive, then within about one second launch another swarm from that hive, the swarm doesn't start over. Instead, it passes straight through and becomes a **Super Swarm**.

The new swarm starts with all the power it carried into the friendly hive, then continues collecting any additional bees it encounters on the new lane before crashing into its final destination.

Used correctly, Super Swarms can deliver absolutely devastating attacks.

Barracks

Some maps contain Barracks.

Barracks cannot be attacked directly, nor can you send bees to them. Instead, they are controlled by the ring of hives surrounding them. You'll know which hives belong to the Barracks because they're connected by circuitry.

Control **every** surrounding hive and the Barracks comes online.

Lose even **one** controlling hive and the Barracks immediately shuts down.

A Barracks sends additional bees to your hives. Its strength is determined by the **smallest** controlling hive in its network.

For example:

- If the smallest controlling hive is Small, the Barracks operates as Small.
- If the smallest is Medium, the Barracks becomes Medium.
- If every controlling hive is Large, the Barracks operates at full Large strength.

You can also customize where those extra bees go.

Simply **long press** the Barracks to enter Selection Mode. From there, choose which connected hives should receive reinforcements and the order in which they'll receive them. You can send reinforcements to all of them, only a few, or even just one.

Tap anywhere on empty space to exit Selection Mode. Your preferences are automatically saved.

If the Barracks ever goes offline, those preferences are reset.

Towers

Towers work much like Barracks.

Instead of producing bees, they automatically attack enemy bees that enter their range.

Like Barracks, Towers are activated by controlling every surrounding hive. Lose one controlling hive and the Tower shuts down.

Tower strength is determined by the weakest controlling hive.

The stronger the Tower:

- The farther it can shoot.
- The faster it fires.

And yes... it never misses.

Winning the Game

Destroy every enemy hive before your opponent destroys yours.

Capturing neutral hives early gives you more production.

Protect your strongest hives.

Fight for Barracks and Towers whenever possible.

And when the opportunity presents itself...

Launch a Swarm.
